

Container-based High-Performance Computing Approaches for Simulating Large-Scale Biological Neural Networks

Oliver James and Sungho Hong[†]

Center for Cognition and Sociality, Institute for Basic Science; [†] sunghohong@ibs.re.kr

Introduction

1. Modeling **large-scale, biophysically detailed neural networks** increasingly relies on **high-performance computing (HPC)**.
2. However, deploying simulations of such networks across diverse HPC environments remains challenging due to **software incompatibilities** and **complex dependencies**.
3. We address this issue using **Singularity containers** that encapsulate the entire simulation environment, enabling neuroscientists to achieve portability and reproducibility without requiring root privileges on HPC/Cloud systems.
4. We give practical demonstrations by benchmarking HPC environments with **cerebellar mossy fiber–granule cell network** simulations.

Containerization for Scientific Computing

A container is a lightweight, standalone, virtualized executable environment that includes all dependencies required to run large-scale scientific models.

Our Computational Framework

Benchmarking Data and Network: Cerebellar Mossy Fiber → Granule Cell

Benchmarking Data and Network: Cerebellar Mossy Fiber → Granule Cell

We run multiple copies ($n = 280$) of the network connectivity model simultaneously to simulate extreme computational workloads.

This allows us to rigorously assess the scalability and performance limits of GPUs under high-demand conditions.

Table: Network Configuration

Network elements	Count (millions)
MF	0.299
GRC	1.099
Compartments	3.297
Synapses	3.468

Table: Simulation Setup

Simulation time	1 s
Simulation software	CoreNEURON

Benchmarking HPC Environments

Table: Performance in CPU parallel computing (30-task MPI)

CPU	Core	Solver Time (s)	Simulator
Intel(R)-Xeon	30	1670	CoreNEURON-CPU
